A POSSIBLE OVERDOSE

## POSSIBLE OPIOID OVERDOSE: WHAT TO DO

The person might have used medications or illicit drugs and shows the following signs:

No response to sound or pain

Laboured or snore-like breathing, or absence of breathing

The person seems to be unconscious

**TRY MAKING THEM** RESPOND TO SOUND OR PAIN

**RUB** the centre of their chest (sternum) hard

They are unresponsive

RECOGNIZING

**CALL OR HAVE** SOMEONE CALL

## IF YOU ARE ON YOUR OWN WITHOUT A PHONE:

- Administer a dose of naloxone
- Perform chest compressions for 2 min
- Lay the person on their side
- Find a way to call 911 and follow instructions

They are unresponsive

**ADMINISTER** A DOSE OF NALOXONE

from box: don't test it!

C Insert tip into one nostril. Press firmly with your thumb.

They are unresponsive

PERFORM CHEST COMPRESSIONS **IMMEDIATELY** 

**GIVE** 2 compressions (5 cm deep) per second

**START** giving CPR if you have been trained, using the barrier mask

**ADMINISTER ANOTHER DOSE** OF NALOXONE IN THE OTHER NOSTRIL

**REPEAT STEPS 4 AND 5** as long as the person is unresponsive

Out of naloxone? Continue chest compressions or CPR until help arrives

## IF THE PERSON WAKES UP...

Lay them on their side. Explain what just happened and how it's important that they be seen by a health professional.

The risk of another overdose after the first one is high because naloxone has a short duration of action.

Tell the person that they should not use opioids in the next few hours to avoid another overdose.

Stay with them while waiting for help. The Good Samaritan Law provides protection for overdose witnesses and victims.

- · Store naloxone in a cool, dark place
- · Check the expiry date
- · Leave the spray in its box until it's time to use it
